HSPURIFIER

HYDROGEN SULFIDE REDUCTION - WITHOUT CHEMICALS

ENVIRONMENTALLY FRIENDLY Technology

For more than 25 years the Danish company JIMCO A/S has developed and manufactured some of the world's most unique environmentally friendly purification technologies. JIMCO A/S' environmentally friendly technology takes basic in photolytical oxidation, and this technology can be used to purify both air and water without the use of chemicals.

JIMCO has won the EU's environmental award for cleaner technologies and works to spread out the knowledge about environmentally friendly technologies, so the use of chemicals can be reduced. HS Purifier use photolytical oxidation to purify the air from hydrogen sulfide (H2S). When the H2S level reduces significant, then you protect the electronic from the cabinet by the pump well. If the pump well is located close to a neighbor, then you also avoid neighbor complaints, because the smell is reduced significant.

HS Purifier installs in a pipe in the cabinet as ends in the pump well and is connected to 230 V power supply. Oxygen from the atmospheric air converts by means of JIMCO's special UV-C lamps to ozone as it is blown down in the pump well by a ventilator. The ozone reacts with the hydrogen sulfide and the following chemical reaction occurs:

$O_3 + H_2S \rightarrow SO_2 + H_2O \rightarrow SO_2^{-2-} \& SO_3^{-2-}$

This means that the hydrogen sulfide oxidases and convents to other sulfur connections. The new connections are not dangerous or malodorous

FACTS OF HYDROGEN SULFIDE

Hydrogen sulfide is an inorganic chemical compound with the formula H2S. Hydrogen sulfide is very poisonous, corrosive, and flammable and a mixture of H2S and air can be explosive.

With a content of hydrogen sulfide in the air on less than 0,01-0,02 ppm can the sense of smell start to reveal hydrogen sulfide, by a content on 1 ppm experiences a weak, but unmistakable smell, and by 3-5 ppm feels a strong smell of hydrogen sulfide. By 20-30 ppm do you feel at clear and unpleasant smell, and by 30-150 ppm then can the smell be experienced as sweetish. Finally, will the sense of smell disappear if the content of hydrogen sulfide in the air excess 150-300 ppm. Because of that it is not possible to decide if a location is dangerous because of hydrogen sulfide.

The hygienic limit value for hydrogen sulfide is 10 ppm. By 10-50 ppm occurs a light eye irritation, and by 50-100 more serious eye damages and difficulty breathing after 1 hour in the contaminated air. By 100-200 ppm occurs cough and eye trouble, as after 10-20 minutes is accompanied by dizziness, and with exposure for the gas in more hours can the death occur. By 500-1000 ppm occurs fast unconsciousness, pulmonary edema and death. The acute toxicity of hydrogen sulfide is due to local attacks on tissues, primarily eyes and lungs, and an inhibition of blood's ability to transport oxygen.

Hydrogen sulfide is also a flammable gas which, when mixed with air, is explosive at concentrations between 4 and 46% by volume.

ADVANTAGES WITH **HSPURIFIER**

- ✓ Reduces hydrogen sulfide effective
- ✓ Sterilizes the air
- Reduces smells to the surroundings
- Avoid neighbor complains
- Environmentally friendly purification
- ✓ No use of chemicals
- Needs just 230 voltage power supply to work
- ✓ Low operation- and maintenance costs
- ✓ Easy to install
- Extends the life of activated carbon

INSTALLATION

The HS Purifier is connected to a 230V power supply and is mounted vertical in an \emptyset 110 PVC tube with the ventilator on top. The \emptyset 110 tube ends in the pump well and the ozone will go through the tube into the pump pit.

PURIFICATION PROCESS

Oxygen in the atmospheric air is converted into ozone by using JIM-CO's special HS lamp. The ozone is blown to into the pump pit by a ventilator mounted on the HS Purifier. The ozone will react with hydrogen sulfide and the following chemical reaction occurs in pump well:

$O_3 + H_2S \rightarrow SO_2 + H_2O \rightarrow SO_2^{-2-} \& SO_3^{-2-}$

This means that the hydrogen sulfide is oxidized into a sulfur compound and is therefore no longer dangerous or malodorous. NO CHEMICALS "At Svendborg wasterwater we carried out a test with JIMCO's HS Purifier and showed that it effectively reduces H2S."

Thomas Egel - Technician Svendborg Wasterwater

> "We use JIMCO's HS Purifier in several of our pump wells to reduce odor to the surroundings and to neutralize hydrogen sulfide. We have been working with JIMCO for more than 10 years."

Bjarni Hansen - Operations Manager Langelands Forsyning

"We brought 5 HS-Purifiers from JIMCO.We mounted 4 and had good results with the 3 of them. The last one did not show immediate results, but after 14 days of operating there was a noticeable difference in the well. We are very satisfied with the JIMCO HS-Purifiers"

Alex Olsen - Teamleader Sorø Forsyning A/S

ECO FRIENDLY We brought a HS-Purifier Medium from JIMCO and installed it in a pumping well with high hydrogen sulfide levels.We installed the HS-Purifier from JIMCO in early October 2019 in a pumping well equipped with loggers.

After approximately 45 days of operation, we compared the result with the measurements from the same period in 2018 and demonstrated a high hydrogen sulfide reduction.

Since then we have not received any neighbor complaints, but we are still following the development closely.

Cecilie Bak - Engineer Ringkøbing-Skjern Forsyning A/S "In the begninng af september 2019, we installed 3 of JIMCO's HS-Purifiers in connection with a well where neighbors had complained a lot about of smells. Previously, we spend around 90-100.000 DKK annually on chemistry to combat hydrogen sulfide.

We mounted a HS-Purifier in the well in front of the well with challenges, and we mounted one in the reservoir for the well with challenges, and then we mounted the most powerful HS-Purifer in the well with challenges.

After only two months of operating, we do not have to dose chemistry anymore and the average hydrogen sulfide level is acceptable, between 5-8 ppm.

After 3 months of operating the chemistry is still off, and we get no neighbor complaints. I think it is impressive what we have achieved with the JIMCO equipment"

Brian Offe Rasmussen - Craftsman Lolland Forsyning A/S

Reduction of peaks after 3 months operation from 250 ppm to 30 ppm Average level of hydrogen sulfide is reduced from 70 ppm down to 6-7 ppm

HSPURIFIER 16 (LOW)

HS UV-C lamp: 1×16 W Operating hours (lamp): 8000 Voltage: 230 V Power consumption: 21 W Finish: Stainless steel AISI 304 Dimensions: H: 550 mm Ø: 103 mm Weight: 2,62 kg

HSPURIFIER 40 (MEDIUM)

HS UV-C lamp: 1×40W Operating hours (lamp): 8000 Voltage: 230V Power consumption: 45 W Finish: Stainless steel AISI 304 Dimensions: H: 550 mm Ø: 103 mm Weight: 3,60 kg

HSPURIFIER 80 (HIGH)

HS UV-C lamp: 2×40 W Operating hours (lamp): 8000 Voltage: 230 V Power consumption: 85 W Finish: Stainless steel AISI 304 Dimensions: H: 550 mm Ø: 103 mm Weight: 3,90 kg

REDUCTION WITH **HSPURIFIER**

The reduction of hydrogen sulfide in % depends on the bacteria level in the putt, but an estimated reduction in % based on feedback shows following:

 800 ppm
 ca. 50% Reduction
 100-150 ppm
 ca. 80% Reduction

 300 ppm
 ca. 67% Reduction
 60 ppm
 ca. 90% Reduction

JIMCO has also launched HS Purifier Medium and HS Purifier High which accordingly is 2.5 times and 5 times more powerful than HS Purifier Low

"We installed HS Purifier in the first main pump station from a newly sewed cottage area in February 2019. The temperature in the well was around 8-12 degrees. We do not use hydrogen sulfide upstream, there are no irrelevant water and the string is separated from rainwater.

In the pumping station have we for a long time had a sulfur hydrogen logger placed. Before we mounted the JIMCO's HS purifier, the logger showed tips of 2-300 ppm and an average 60-80 ppm. Occasionally, the tips could reach 350-400 ppm.

Two weeks after mounting of the JIMCO's HS Purifier, we received a measurement that showed 2 peaks of 103 ppm and an average of 11 ppm. The duration of the measurement was four days. The subsequent measurement results also with a duration of four days showed the following:

- Peaks of 73 ppm and an average of 7 ppm.
- Peaks of 68 ppm and an average of 7 ppm.
- Max peak of 45 ppm and average of 8 ppm.

After 3 months we are at about 30 ppm in tips and some at 40 ppm with an average fluctuating between 5-8 ppm."

Claus Trabjerg - Smed ·Vestforsyning A/S in Holstebro Tlf.: +45 5158 7430 · Mail: ct@vesJorsyning.dk

REDUCTION WITH **HSPURIFIER**

Hydrogen sulfide levels with use of HS Purifier Medium shows 1,14 % of the measurements is above 5 ppm against 41,6 % without use of HS Purifier Medium.

Hydrogen sulfide levels with use of HS Purifier Medium shows 0,05 % of the measurements is above 10 ppm against 28,4 % without use of HS Purifier Medium.

Hydrogen sulfide levels with use of HS Purifier Medium shows 0 % of the measurements is above 20 ppm against 16,4 % without use of HS Purifier Medium.

The use of activated carbon in the wastewater industry is generally known but challenged by the fact that the active carbon does not always work efficiently or last long.

In the case of special pollution, it can be relevant to choose a special impregnated carbon type. This is also the case for purification of hydrogen sulfide in wastewater. With the right type of carbon for hydrogen sulfide, can up to 50% of the weight of the carbon be absorbed. With an unsuitable carbon type, the carbon may only occupy 5-10%.

JIMCO's HS Purifier can be combined with an active carbon filter in the cabinet. One cabinet can be dug underground and the other can be placed over ground.

ENVIRONMENTALLY FRIENDLY Hydrogen Sulfide Filters

HYDROGEN SULFIDE FILTERS UNDER TERRAIN

In the hydrogen sulfide filter under ground, the HS Purifier is placed so the UV-C produced ozone gets access to the pump well and is supplied to the well using the HS Purifier's ventilator.

The ozone reacts with the hydrogen sulfide, and the air leaves the well. Then the air passes through the active carbon, which is placed in the filter house as granules. The carbon absorbs and binds the remaining hydrogen sulfide and ensures an optimal solution for reducing odor and pollution to the surroundings.

ENVIRONMENTALLY FRIENDLY Hydrogen Sulfide Filters

HYDROGEN SULFIDE FILTERS OVER TERRAIN

In the hydrogen sulfide filter over ground, the HS Purifier is placed so the UV-C produced ozone gets access to the pump well and is supplied to the well using the HS Purifier's ventilator.

The ozone reacts with the hydrogen sulfide, and the air leaves the well. Then the air passes through the active carbon, in the carbon cartridges in the filter house. The carbon absorbs and binds the remaining hydrogen sulfide and ensures an optimal solution for reducing odor and pollution to the surroundings.
