

Schaffelaarbos Symrise: Odour Control with Care – A JIMCO Success Story from the Netherlands

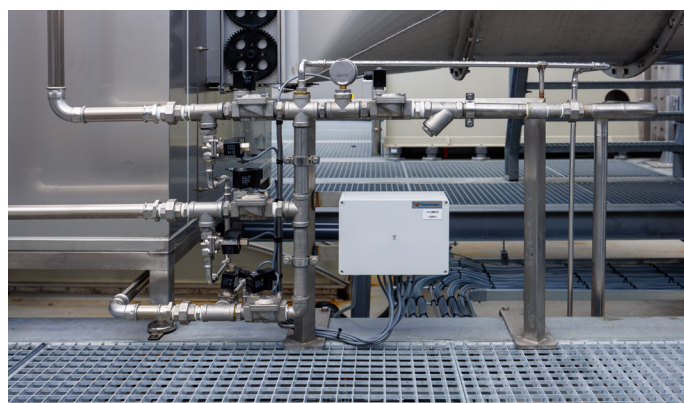

NEWS FROM

The Challenge

Schaffelaarbos Symrise, located in Barneveld, the Netherlands, produces proteins for the animal feed industry and processes up to **90,000 m³ of air per hour**.

The Solution

The solution was the installation of a **JIMCO air purification system**, which uses photolytic oxidation to break down odour-causing compounds.

This technology converts the compounds into harmless by products such as water vapor and carbon dioxide – without the use of chemicals.

The system was quickly put into operation and was able to efficiently treat the large volume of air generated by the production process.

The Result

- Significant reduction of VOCs and unpleasant odours
- Positive feedback from neighbours and the local community
- Enhanced reputation as a responsible and environmentally conscious company

The JIMCO system has not only solved a technical challenge – it has also strengthened Schaffelaarbos Symrise's image as a company focused on sustainability and responsibility.
